<p>Synoptically, a large upper trough extended across the northern and central Rockies. An upper level shortwave ejected across the southern plains off of the larger scale trough, and interacted with a moist and unstable airmass east of a cold front. The cold front was positioned along the Interstate 35 corridor when storms developed. These storms began to impact extreme southeast Kansas and the Missouri Ozarks during the early morning hours of 22 April. Mainly large hail and localized flooding were the primary hazards with this activity. Other storms redeveloped during the afternoon and evening hours of 22 April.</p>

Power poles were blown down from severe thunderstorm wind gusts near the intersection of Highway 54 and Highway 43.				
<p>Repeated development of storms along and north of an advancing warm front led to a large swath of greater than three inches of rain south of a line from Stockton to West Plains. This excessive rain occurred on wet soil conditions from record rainfall in February and March. Nearly 100 reports of flash flooding were received between midnight and 11 am on the 10th. Two fatalities occurred from this episode of dangerous flash flooding. Record flooding occurred along Lake Taneycomo as high releases from Table Rock Lake Dam flooded all lowlands along Taneycomo, including numerous frame and mobile homes. The Core of Engineers released 46,500 cubic feet per second, which was an all time high. The lake crested at 933.25 feet above sea level, which was a record level. Due to an unusually high water table along with saturated soil conditions, all counties within the NWS Springfield County Warning Area experienced widespread flooding on nearly all secondary roads. Emergency Management Directors across the region that were responsible for baracading roads, stated that as little as one half of an inch of rain was causing widespread road closures across their county of interest.</p>

Severe thunderstorm wind gusts destroyed a barn.				
<p>Synoptically, a large upper trough extended across the northern and central Rockies. An upper level shortwave ejected across the southern plains off of the larger scale trough, and interacted with a moist and unstable airmass east of a cold front. The cold front was positioned along the Interstate 35 corridor when storms developed. These storms began to impact extreme southeast Kansas and the Missouri Ozarks during the early morning hours of 22 April. Mainly large hail and localized flooding were the primary hazards with this activity. Other storms redeveloped during the afternoon and evening hours of 22 April.</p> <p>A cold front, positioned along the I-35 corridor early in the event, was expected to cross the CWA by early in the afternoon. During the afternoon of the 21st, a lead shortwave interacted with warm advection to kick off severe storms over Oklahoma that congealed into a mesoscale convective system which entered the SGF CWA shortly after midnight.</p>
